Name and title: Grace Denny, LCMN Lab Manager

Email: lcmn.tamu@gmail.com

Employer: Dr. Jessica Bernard, Texas A&M University

The Lifespan Cognitive and Motor Neuroimaging Lab has been conducting a study on how as we get older, our behavior and brains begin to change. We may experience changes in memory, attention, and how well we move. Understanding these changes can provide us vital information to develop interventions that improve the life and health of older adults. Edith was kind enough to participate in our Aging Brains study and dedicate her time to contribute to our research. Over the course of three years, we track the changes in both behavior and in the brain. Specifically, we are interested in understanding the cerebellum as it is a key contributor to motor and cognitive function, but also how it interacts with the rest of the brain. Edith completed a brain imaging scan and behavioral test sessions where she performed tests of balance and motor function, as well as tests that looked at memory and attention. Edith invested many hours into our research and we cannot thank her enough!

Best,

Grace
